Abstract

The Primary purpose of a computer network is to share resources. A computer network is referred to as client/server if (at least) one of the computers is used to server other computer referred to as client. Beside the computers, other types of devices can be part of the network. In the early day of networking there will be once central server that contains the data and all the clients can access this data through a Network Interface card. Later on client server architecture came into existence, where still burden is there on the server machine. To avoid the disadvantages in distributed computing was introduced which reduce the burden on the server by providing work sharing capabilities. This paper describes how the concept of distributed computing came into existence based on the advantages and disadvantages that raised in earlier networking concepts. The concepts of distributed computing speaks that once data is available within the server (s), it should be able to be accessed and processed from any kind of client device like computer, computer, mobile phone, PDA, etc.

ACKNOWLEDGMENT

First we would like to thank the Almighty for his wonderful presence with us throughtout the

completion of the project and making it as a successful one.

We are expressing our deep gratitude to COURT ROAD NETWORKZ SYSTEMS INSTITUTION which provided us an opportunity in fulfilling our most cherished desire in reaching our goal.

This is a great pleasure to express our deep sense of gratitude and thanks to our guide MISS ANTONET REETA for her valuable ideas, instantaneous help, effective support and continued encouragement which enabled for the successful completion of the project

We gratefully remember the available suggestion of our respective staff for their valuable and timely guidance for the completion of the project.

We gratefully remember the available suggestion of our respective staff for their valuable and timely guidance for the completion of this project. Finally we would like to express our sincere thanks to all our friends who gave good ideas not suggestions for our project.

INTRODUCTION

Networking is referred as connecting computers electrically for the purpose of sharing information. Resources such as a file, application,

printer & software. The advantage of networking can be seen in the terms of security, efficiency, manageability and cost as it allows collaboration between user in a wide range. The switches and router this device that play an important role in data transfer from one place to another using different technology such as radio waves & wire.

Networking Requirement

1. The active networking components (Routers, Switches, Wireless access points etc) with quantity.
2. The IP network design for each department.
3. Dynamic IP addressing design for all networks
4. Identify the configuration and features, wherever appropriate, which is required on the active components to setup the network.
5. Analysis, identification and explanation of methodologies to use for access restriction and internet sharing.
6. Creating and mapping IP networks with vlans.

HARDWARE REQUIREMENT

- Processor AMD PRO A4-4350B R4,5 COMPUTE
 CORES 2C
 +3G 2.50GHz

- RAM 4.00 GB
- System Type 64-bit operating system

REQUIREMENT

1. The following use cisco packet tracer to design and implement the network solution
2. Use RIP as the routing protocol
3. Configure SSH in principal room and telnet in staff room
4. Principal room, Staff room, Computer lab 1 and computer lab 2 required to have a wireless network for the users
5. Datascience and Multimedia should be in a different vlan
6. Class C type IP address used in every department
7. Device in Datascience and Multimedia are required to communicate with each other with the respective switch configured for intervlan routing
8. Devices in computer lab 5 are allocated IP address statically
9. Devices except computer lab 5 are allocated IP address dynamically
10. Test communication ensure everything configured is working as expected

SOFTWARE REQUIREMENT

- CISCO Packet Tracer
